TASK-1 PROJECT REPORT

I created this info-graphic using Canva, a flexible design platform that is great for visualizing educational ideas like digital literacy. The tool helped me organize complex information into a clean, easy-to-read layout. I used a consistent green and black color scheme to keep it visually appealing.

The design serves as a quick-reference guide. It breaks down digital literacy into three key components: a clear definition, tool recommendations for students, and practical safety tips. By using "sticky-note" text boxes and clear headings, I made sure the main ideas—such as finding reliable sources and using multi-factor authentication—stand out.

One thing I found particularly interesting while creating this was how to simplify the information. Digital literacy is a broad topic, so choosing just three tools and four safety rules needed careful thought. It was a helpful exercise in balancing visual space with enough detail to be useful without overwhelming the viewer.

TASK-2 PROJECT FILE

To build a professional digital presence, I chose GitHub, LinkedIn, and Kaggle. These platforms are essential for a modern student in technology. GitHub is my main site for version control and project hosting. I created a profile README to share my academic status and learning goals. LinkedIn serves as my networking hub. I updated my education section to connect with industry experts and find job opportunities. Finally, I use Kaggle as a focused platform for data science and machine learning, providing a competitive space to practice solving real-world problems. In the next four years, I plan to use these tools as a "living portfolio." On GitHub, I will document my coding progress by uploading projects from my courses. On Kaggle, I will take part in community competitions to improve my analytical skills beyond the classroom. At the same time, I will use LinkedIn to build my professional brand, recording my internships and achievements to be ready for my career after graduation. Together, these platforms will help connect my academic learning with real-world applications in the industry.

TASK-3 PROJECT FILE

To show my technical and educational skills, I used HackerRank and Google Forms to explore digital literacy. On HackerRank, I practiced Python programming by solving logic-based challenges, such as the "If-Else" task. This helped me improve my skills in writing clear, conditional code and fixing real-world errors. At the same time, I designed a Digital Literacy Awareness Quiz on Google Forms, focusing on key skills like spotting phishing attempts and managing data privacy. These tools are very useful for my studies. HackerRank helps me prepare for technical assessments and improves my problem-solving skills. Google Forms offers a professional way to collect data and evaluate my peers. By mastering these platforms, I can develop functional software and communicate complex ideas effectively. These abilities are essential for success in today's academic and professional world.

TASK-4 PROJECT FILE

Employees face major issues when they use "Reply All" to send messages which contain confidential information and personal content. A real-world case emerged when a manager accidentally distributed an employee performance review to all members of their department through a wide-reaching lists distribution. The weak digital communication system produced a major privacy violation which caused staff members to lose their motivation and led to an HR complaint. The sender showed no digital mindfulness because they rushed their work and didn't check recipient data before pressing the send button. The sender needed to apply the "Two-Second Rule" which required them to stop and confirm all recipients in the "To" and "Cc" sections. Organizations could restrict the "Reply All" functionality when members exceed a specified group size while email clients should have short time frames which enable users to undo their sent messages. People need to watch their personal information while computers must work to protect digital security in professional online environments.

TASK-5 PROJECT REPORT

I was surprised when I started my research into digital awareness and cyber security, to discover how many modern phish and social engineers truly leverage psychological vulnerability. I had previously always pictured modern cyber crime as somehow being very tech savvy, and breaking in to a secure server with a large dose of hacking. However it turned out that the majority of such breaches actually rely on manipulating people's emotion and sense of panic and urgency. Finding out that someone as savvy with computers as myself could be duped into sending personal information over a well- timed SMS or e-mail has certainly opened my eyes as to our level of digital vulnerability.
The direct change to a habit from this research that I will make myself is with public Wi-Fi. It was a habit that I did not really consider before but when I discovered the vulnerability of an open Wi-Fi network at a coffee shop or a station to a "man-in-the-middle" attack where someone can intercept personal data was something which shocked me, and will now see me always connect via my mobile or an encrypted VPN for all academic or personal banking issues.
